

# Load Runner Case Study Explanation

## 1. Open Load Runner Vugen

- First step open Vugen then create new script and solution.
- Then start record.
- Here I am selecting Vuser\_Init, Action, then Vuser\_end.
- After recording the code will generate automatically.

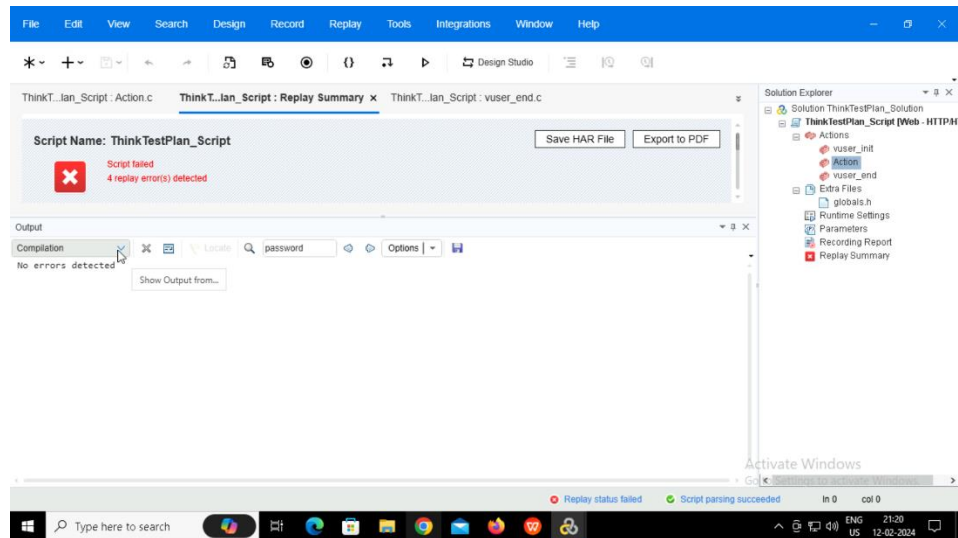

- The below four images shows the recording things.

## 2. Replay Summary

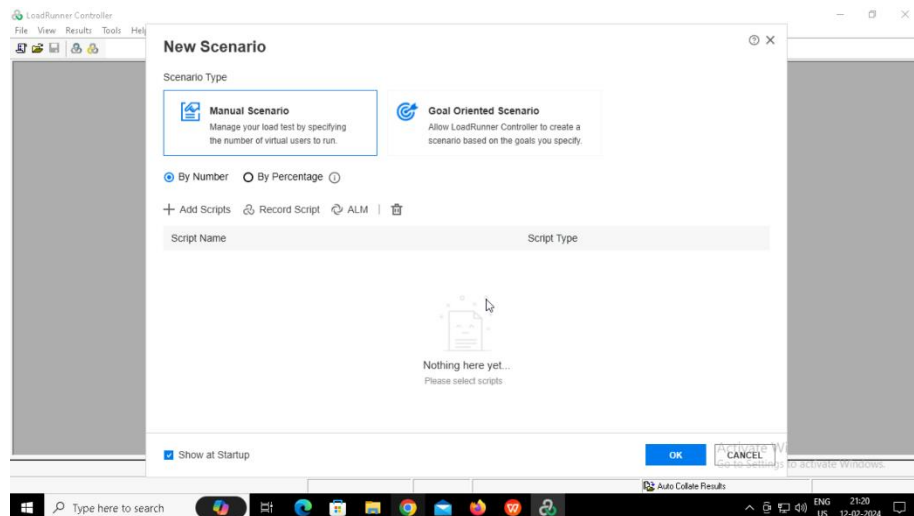

- Before replay summary first I added parametrization then click on replay.
- In replay what it will do is it will check the code is working or not.

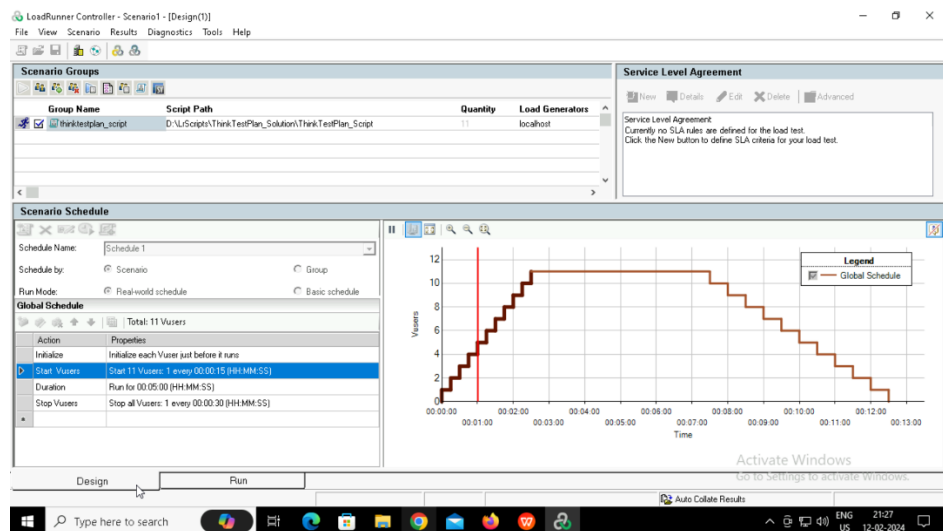

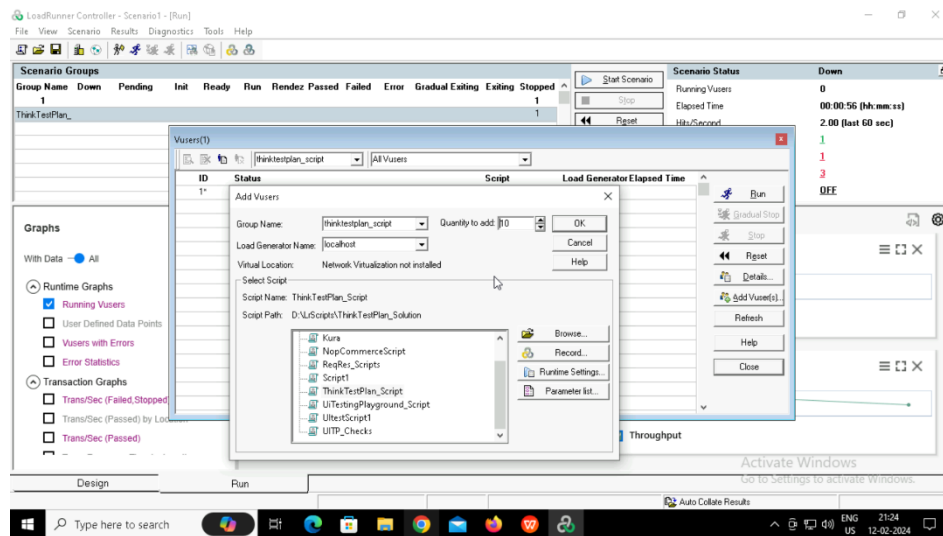

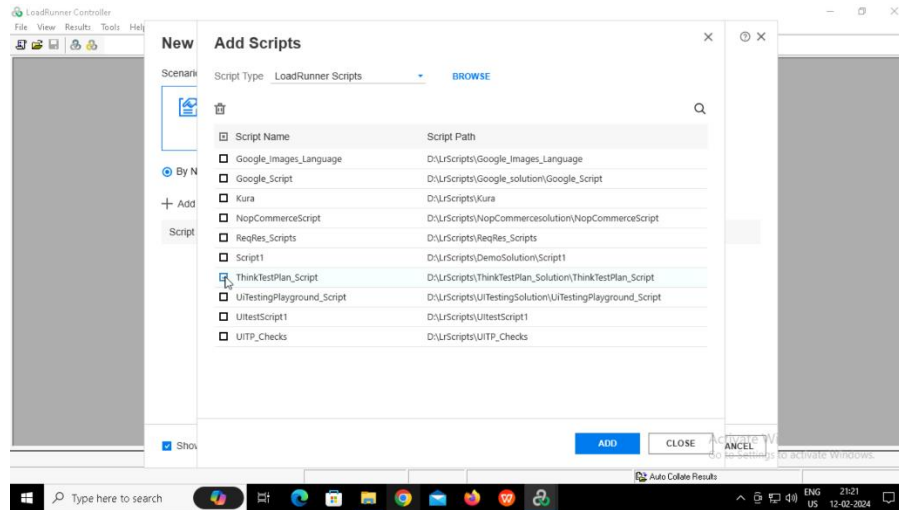

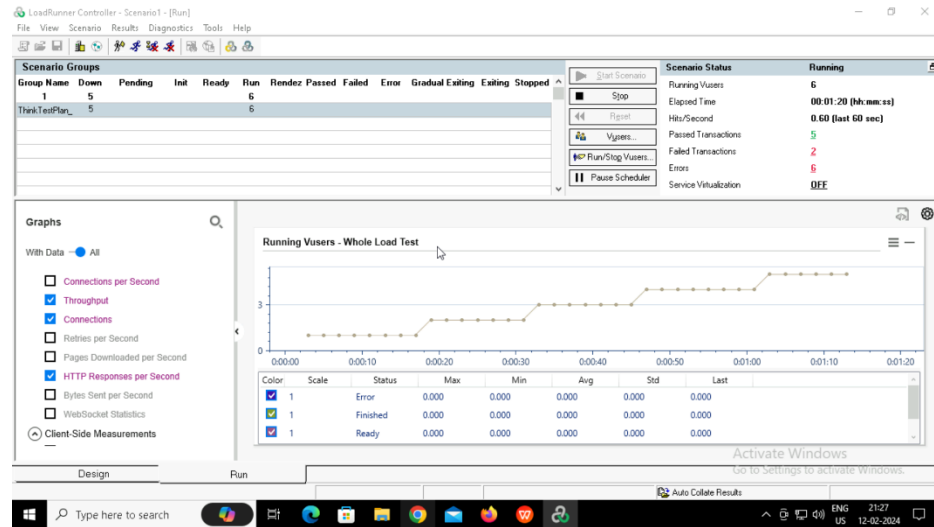

### 3. Open Controller

- The controller part done the testing.
- It will test the script that I added in controller.
- In this controller we can add virtual user and setup the time and choose different set of groups.

#### 4. Analyze the result

- After finishing controller part and analyze that controller result using Analyzer tool.
- In that analyze tool will generate the Html reports.
- In Analyze tool we can add comments also.
